PROFESSIONAL SUMMARY

Full-Stack Engineer with 2+ years at eGain, where my code ran in front of 125K+ daily users across Fortune 500 clients. Since then, built a production AI SaaS from scratch using RAG and LLMs, and have been taking on full-stack and React Native projects for Singapore clients.

WORK EXPERIENCE

eGain Communications – Software Engineer | Mar 2022 – Jan 2024

- Built a role-based article retrieval feature in React with admin-controlled visibility – cut agent search time by ~80% and eliminated a fully manual lookup process across a 125K+ user CRM platform
- Improved page load speed by 35% through lazy loading, state management refactoring, and component restructuring engagement went up 28% after the rollout
- Diagnosed and fixed critical bugs in the email routing and SLA trigger system across Fortune 500 client deployments, resolving incorrect queue assignments, misfiring timers, and workflow failures
- Owned and extended the core Node.js APIs consumed by email, knowledge hub, and professional services teams – fixed broken endpoints, corrected bad data responses, and shipped new APIs to unblock dependent teams

Freelance Full-Stack Developer | Jan 2025 – Present

- Built a custom booking and session management plugin from scratch for a Singapore based fitness business – class scheduling, member management, Stripe payments, and automated email reminders; delivered solo from requirements through deployment
 - Built a maritime SaaS platform from scratch – React 19 + TypeScript, with a 4-role permission system enforced through custom row-level security policies and a self-escalation-blocking trigger written in Postgres
 - Built a column-level access control system – admins can toggle which fields each client group can see or edit, down to individual columns, with masking for restricted fields
 - Built out core business modules (list/detail/edit views) with section-by-section saving instead of one big form save
-

PROJECT

DailyDeck – AI-Powered Full-Stack SaaS Platform daily-deck-ten.vercel.app | github.com/pujeetas/DailyDeck

- Built a RAG pipeline over a personal knowledge base – notes get embedded with Cohere and stored in MongoDB Vector Search, so as you're writing, it surfaces relevant past notes with a link straight back to the source
 - Built out CI/CD from GitHub straight to production with MongoDB Atlas, added uptime monitoring (100% availability so far), and containerized locally with Docker multi-stage builds so dev matched prod exactly
 - Implemented unit and integration tests using Vitest and React Testing Library covering authentication and core user flows; integrated GitHub Issues API to sync external tasks into an internal Kanban workflow
-

SKILLS

Languages: Node.js, JavaScript, TypeScript, SQL

AI and Data: RAG Architecture, LLM Integration, CohereEmbeddings, Claude AI, Prompt Engineering, MongoDB Vector Search, Semantic Search

Backend: Node.js, Express, REST APIs, WebSocket, Microservices

Frontend: React, TypeScript, Redux, Zustand, Tailwind CSS, Ant Design

Cloud and DevOps: AWS (EC2, S3), Docker, Docker Compose, CI/CD, Vercel, Git, GitHub

Databases: MongoDB, PostgreSQL, MySQL, MongoDB Atlas Vector Search

Testing: Jest, Vitest, React Testing Library

Methodologies: Agile, Scrum, Code Reviews, Object-Oriented Design

EDUCATION

B.TECH IN COMPUTER SCIENCE ENGINEERING | AMITY UNIVERSITY 2016 - 2020
